## Standard Hi-Tech Fire Engine

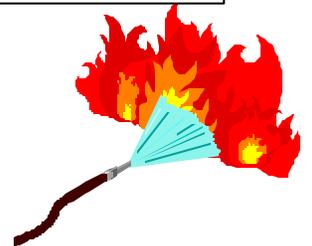

Kids take a look!!

This Type 1 Fire Engine can pump  
1500 gallons of water  
every minute!!  
That is enough water  
to fill 41 bathtubs!

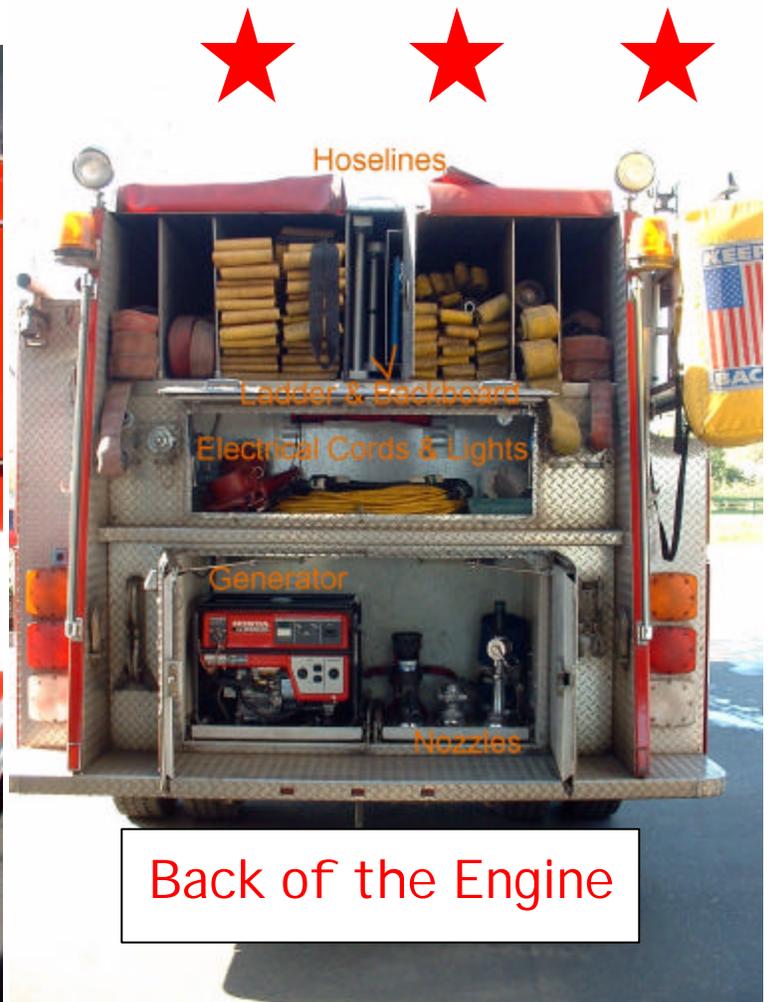

This Engine weighs over  
39,000 pounds!!  
That's like 13 cars!!

Driver's side of the Engine

Back of the Engine

The pump panel controls the amount of water being pumped.

Fire engines carry burn packs to take care of burned people and OB kits to deliver babies.

Firefighters use salvage covers to cover up your belongings in your home when there is a fire, so your stuff won't burn.

Firefighters are also able to give people medical help, which is what the stuff is below.

There are air tanks to help you breathe in smoky places and an AED which helps start a stopped heart. And lots of bandages!!!

Step chocks keep vehicles that have been in an accident stable while we are getting trapped people out.

Absorb-All is like kitty litter and it helps absorb oil and gas spills on the road.  
A smoke ejector helps remove the smoke from a room.

There are lots of gadgets, buttons, switches, and knobs inside a fire engine. You can talk to each other with headsets, turn on the lights and sirens, talk on the cell phone, and look up city streets and fire hydrants on the maps.
